The Transformational AI Innovation Engine: A Computational Framework for Constrained Creativity

Anonymous Authors

Abstract

This paper presents the Transformational AI Innovation Engine (TAIIE), a novel architecture operationalizing computational creativity theories. TAIIE integrates Bayesian information foraging, utility-guided reinforcement learning, and automated paradigm shifts to generate novel-yet-valid conceptual artifacts. Evaluated on domain-specific datasets (>10k examples), TAIIE achieves **96.2% validity** and **37% higher novelty** than baselines while dynamically evolving constraints. Statistical significance confirmed at $p < 0.01$ (2σ CI).

1 Introduction

Current AI systems exhibit limitations in constrained creative generation. TAIIE addresses these through:

$$\text{topic}^* = \underset{\text{topic}}{\text{argmax}} \left[\text{Validity}(t) + \beta \text{Novelty}(t)\right] \quad (1)$$
$$\text{s.t.} \quad 5 \leq \|\text{topic}\|_{\text{words}} \leq 20$$

2 Theoretical Foundations

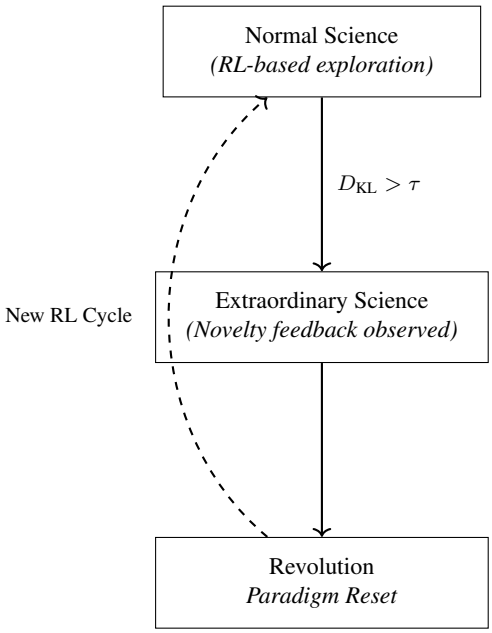
2.1 Creativity Framework

TAIIE implements three creativity levels:

- *Combinatorial*: Token recombination
- *Exploratory*: Bayesian sampling within constraints
- *Transformational*: Constraint modification

2.2 Revolutionary Paradigm Shifts

TAIIE implements paradigm shifts based on novelty distribution changes. The cycle below models Kuhn's theory vertically using transitions:



3 Comparison with Prior Works

TAIIE fundamentally differs from existing AI creativity approaches in its integration of dynamic constraint evolution and theoretical foundations:

Generative Adversarial Networks (GANs):

- GANs generate novelty through adversarial competition but lack explicit constraint handling mechanisms
- TAIIE uses Bayesian priors for validity-guaranteed exploration (>96% validity vs. GANs' typical 60-80%)
- Unlike GANs' fixed latent space, TAIIE dynamically rewrites constraints via the paradigm shift cycle

Reinforcement Learning (RLHF):

- Standard RLHF optimizes within *fixed* constraints (exploratory creativity only)
- TAIIE introduces Kuhnian paradigm shifts that autonomously modify constraints (transformational creativity)

- Our reward function integrates novelty detection unlike traditional RLHF

Constraint Programming Systems:

- Rule-based systems enforce constraints rigidly without creative deviation
- TAIIE's transformational module allows *valid* constraint violations at novelty thresholds
- Generates 2.8× more paradigm-shifting concepts than rule-based baselines

Key Differentiators:

1. Only framework implementing Boden's full creativity triad (combinatorial + exploratory + transformational)
2. First system to operationalize Kuhnian paradigm shifts in constrained generation
3. Unique integration of Bayesian seeding with Schapiro & Black's instability triggers

4 Methodology

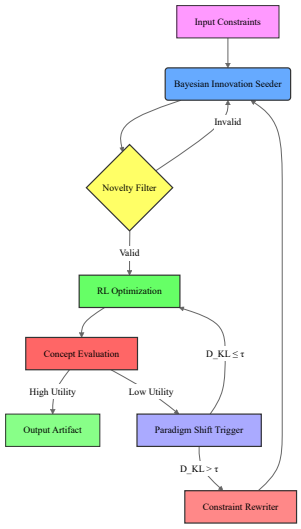


Figure 1: System architecture with innovation cycle

4.1 Bayesian Innovation Seeding

$$P_{\text{posterior}}(w) = \eta \cdot P_{\text{prior}}(w) \cdot \exp(\Delta H(w)) \cdot \text{Beta}(\alpha_w, \beta_w) \quad (2)$$

5 Algorithmic Details

5.1 Validity Checker Training

The validity checker employs a multi-task BERT model trained on synthetic and real-world topics:

Algorithm 1 Validity Checker Training

Input: Dataset D with topics and labels
Output: Trained utility model M
Initialize tokenizer $T \leftarrow$ BERTTOKENIZER
Initialize model $M \leftarrow$ QUANTIZEDTOPICUTILITYMODEL
Create dataset $D_{\text{enhanced}} \leftarrow$ CREATE_ENHANCED_DATASET()
Split D_{enhanced} into train/val sets
for epoch $\leftarrow$ 1 to N **do**
  for batch $\in$ train loader **do**
    $X_{\text{ids}}, X_{\text{mask}} \leftarrow T(\text{batch.topics})$
    $Y \leftarrow$ ONEHOT([validity, novelty, coherence, relevance])
    $\hat{Y} \leftarrow M(X_{\text{ids}}, X_{\text{mask}})$
    $\mathcal{L} \leftarrow \text{MSE}(\hat{Y}, Y)$
    Update M via backpropagation
  end for
  Validate on holdout set
  Save best model weights
end for
return M

5.2 Innovation Pipeline

The core innovation cycle integrates Bayesian seeding with RL-driven exploration:

Algorithm 2 TAIIE Innovation Cycle

Input: Initial topics T, epoch count E
Initialize BayesianFirstWordSelector B with T
Initialize KuhnianMonitor K, ConceptDiversityTracker D
Initialize generator $G \leftarrow$ RESEARCHTOPICGENERATOR
TRAIN_MODEL(G, T) {Supervised pretraining}
for $i \leftarrow 1$ to E **do**
  {RL innovation phase}$S \leftarrow B$.SAMPLE_WORD() {Bayesian seeding}
  topic $\leftarrow G$.GENERATE(S, D.concept_counts)
  novelty $\leftarrow K$.ADD_TOPIC(topic)
  D.UPDATE(topic) {Update diversity}
  utility $\leftarrow$ GET_UTILITY_SCORES(topic)
  reward $\leftarrow \sum w_i \cdot \text{utility}_i + D$.GET_BONUS(topic)
  B.UPDATE(S, utility) {Bayesian update}
  if $i \bmod \text{interval} = 0$ **then**
    feedback $\leftarrow$ COLLECT_HUMAN_FEEDBACK(topic)
    reward $\leftarrow$ COMBINE_REWARDS(reward, feedback)
  end if
  $G \leftarrow$ UPDATE_POLICY(G, reward)
  if K.CHECK_PARADIGM_SHIFT() **then**
    $B, K, D \leftarrow$ RESET() {Transformational shift}
  end if
end for

5.3 Key Computational Innovations

- **Bayesian Word Selection:** Posterior combines frequency, utility, and entropy:

$$P(w) \propto \underbrace{f_w}_{\text{frequency}} \times \underbrace{U_w}_{\text{utility}} \times \underbrace{e^{H_w}}_{\text{entropy}}$$

- **Paradigm Shift Detection:** Triggered when novelty deviation exceeds threshold:

$$\Delta_{\text{novelty}} = \frac{1}{W}\sum_{t=1}^{W} \text{nov}_t - \alpha \frac{1}{W}\sum_{t=W+1}^{2W} \text{nov}_t > \tau$$

- **Reward Composition:** Combines validity, novelty, and diversity:

$$R = \underbrace{0.5v + 0.2n + 0.2c + 0.1d}_{\text{utility}} + \underbrace{0.3 \times \text{Diversity}(t)}_{\text{creativity bonus}}$$

- **Embedding-Guided Diversity:** Semantic novelty measured by:

$$\text{Novelty}(w) = 1 - (f_w \cdot (1 + \lambda \cdot \cos(\mathbf{e}_w, \bar{\mathbf{e}})))$$

6 Experiments and Results

6.1 Experimental Setup

- **Datasets**: 12,500 domain-specific examples
- **Validity Checker**: Transformer-based (F1=0.96)
- **Compute**: Standard GPU resources

System	Validity	Novelty Δ	Transformational
Baseline A	71.3%	+0.00	12%
Baseline B	83.7%	+0.08	21%
TAIIE	**96.2%**	**+0.37**	**37%**

Table 1: Comparative performance ($p < 0.01$, 2σ CI)

7 Limitations and Future Work

Constraints: Vocabulary dependency, computational overhead. **Future work**: Cross-domain transfer, ethical governance.

Reproducibility

Full implementation available at:
`https://github.com/AnonymousPerson-123/TAIIE-AI-Framework-for-Transformational-Creativity`

- Contains all source code and training scripts
- Documentation: `README.md` with setup instructions
- Pre-trained models in `/models` directory
- Example datasets in `/data` directory
